

HW 1.1a

Name(s): _____

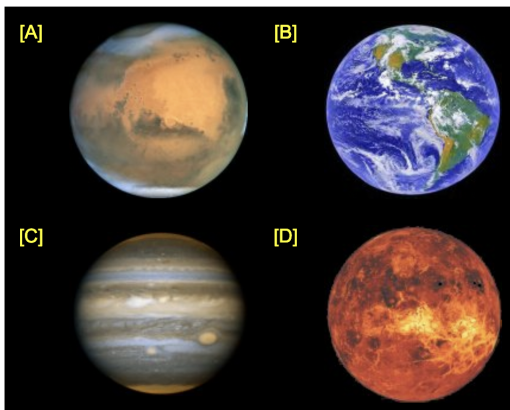

1. Rank the following objects from smallest to largest: cluster of galaxies, galaxy, planet, and star.

2. Planet Jupiter is _____ the Earth.

3. Rank the following objects from smallest to largest.

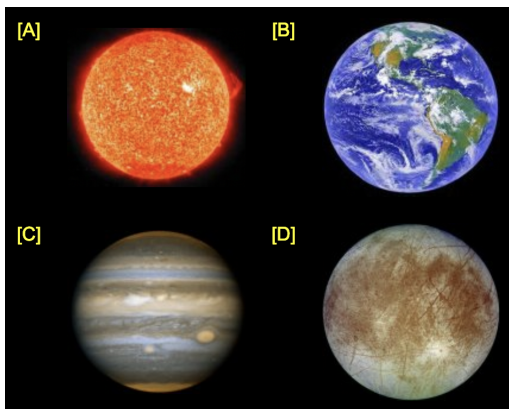

4. Which of these solar system objects is not like the others?

5. The Sun is _____ the distance between the Sun and the Earth.

6. The official name of our planet (the Earth) is _____

7. Which of these objects is the hottest _____?

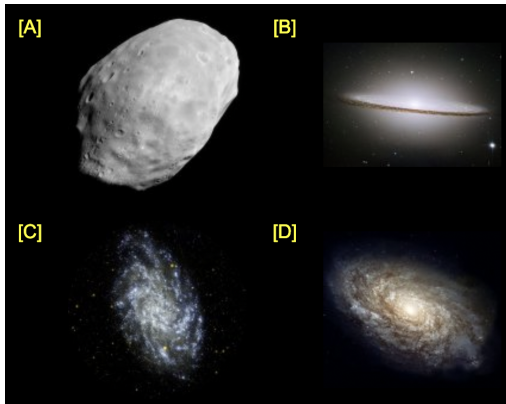

8. Molecules are complex structures made of _____ atoms.

9. The name of our galaxy is _____.

10. (Chem review) The subatomic particles called protons, neutrons, and electrons each carry a positive, neutral, and negative charge respectively. If a triply ionized atom of carbon contains six protons, six neutrons, and three electrons, what is its net charge?

11. Which of these objects is not like the others?

12. The Moon appears so much larger than planet Jupiter in the sky because it .

13. A planet is to a star as a(n) _____.

- A. telescope is to an observation
- B. atom is to a galaxy supercluster

- C. star is to a galaxy
- D. comet is to a moon

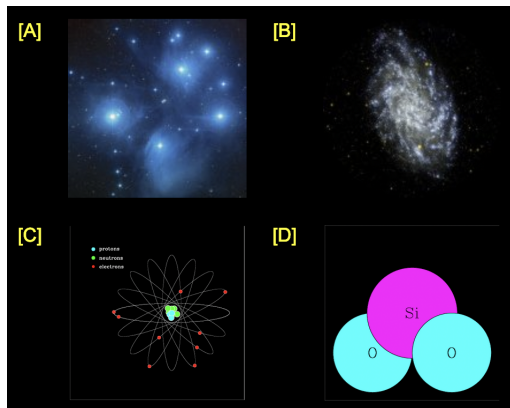

14. If viewed from another solar system, the Sun would appear _____.

15. The Sun seems so much brighter than the other stars in the sky because it is _____.

- A. much further from Earth than they are
- B. intrinsically brighter than any other star
- C. much closer to Earth than they are
- D. intrinsically fainter than any other star

16. The diameter of Jupiter is about _____times the diameter of Earth.
The diameter of the Sun is about _____times the diameter of Jupiter.

17. Rank the following objects from smallest to largest.

18. James Webb Space Telescope (JWST) is located in _____.

19. A group of hundreds or thousands of stars is called a _____.
A group of hundreds of millions of stars is called a _____.

20. The most common element in the Universe is _____.

21. The names of the first three elements in the periodic table are _____.

22. The planets orbit around the _____ along fairly _____ paths.
